SENSay for therapists

One record across home, school and therapy, so you work from evidence

Guide	SENSay for therapists
Date	23 Oct 2026
For	Speech and language therapists, occupational therapists, educational psychologists and other clinicians
In short	Families share their child with you. You see one record of the child's communication across home, school and therapy, with modelling and play kept out of the counts, and your advice reaches every adult around the child
Contact	support@sensay.uk

1. What SENSay does for therapists

SENSay gives you one record of a child's communication across home, school and therapy, so you plan sessions and write reports from evidence rather than from memory. Families share the record with you, one child at a time. You see what the child said, when and where, their targets and the evidence against them, and you add your own notes and advice for home and school.

You need	SENSay gives you
To know what happened between sessions	Every message the child sent at home and school, by week, with what came before it
The child's own use, not the adults'	Adult modelling kept out of every count; repeated play taps counted once
Progress against targets	School targets with evidence by level of support, and therapy targets alongside
A summary before each appointment	A one-page appointment summary, printable, with no AI
Your advice followed at home and school	Session notes with "Advice for home and school" that the family and school both see
Evidence for reports and reviews	Words used, new words, core vocabulary and target words, ready to quote

SENSay does not diagnose, assess or recommend a device. It shows what the child communicated; the clinical judgement is yours.

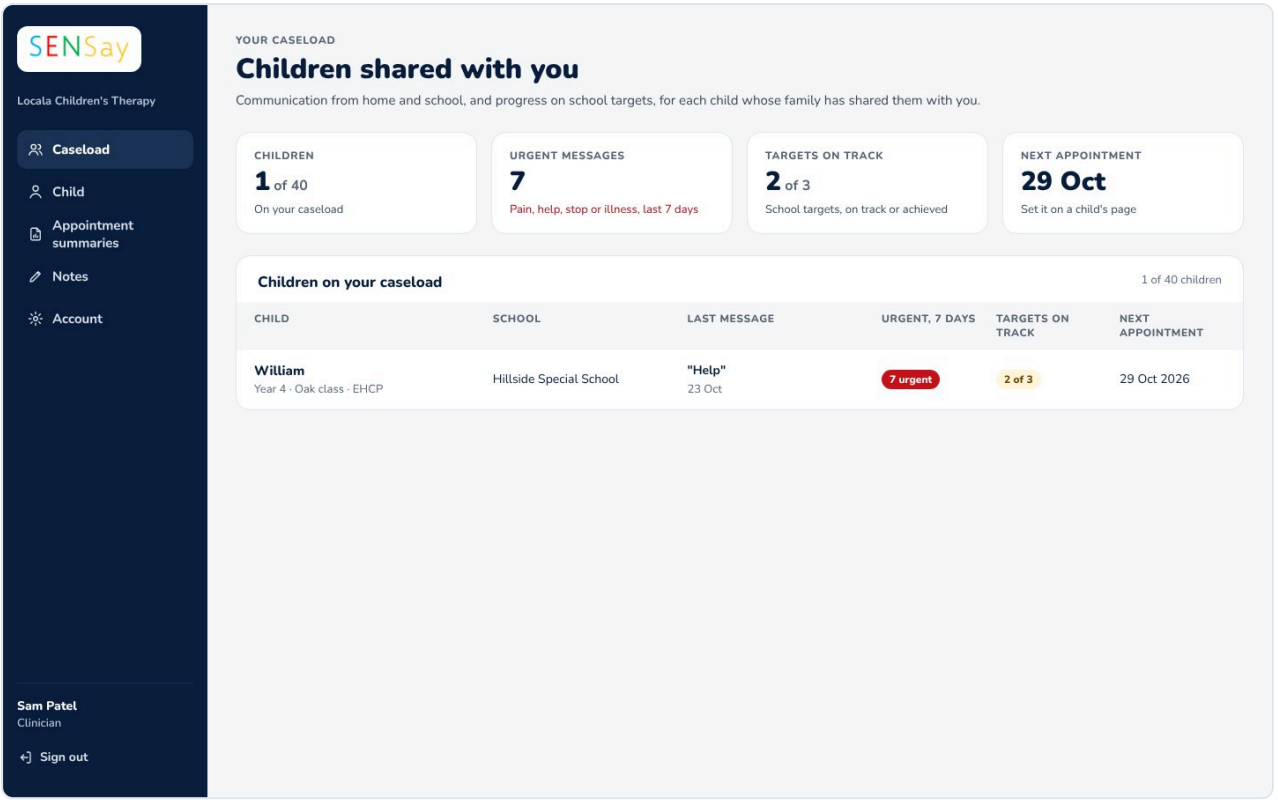

2. How you get access

Access always starts with the family.

1. The parent opens Sharing in their app, chooses **Share with a therapist**, and enters your email.
2. They choose the scope: - **Everything:** board messages, targets, school evidence and reviews. - **Plans and progress only:** everything except board messages.

3. You sign up at app.sensay.uk with that email and choose "I am a therapist or clinician". Enter your name and profession (speech and language therapist, occupational therapist, educational psychologist, physiotherapist, paediatrician or other). The child joins your caseload.

The family can change the scope or stop sharing at any time, and your access ends straight away. A caseload holds up to 40 children; a child shared beyond that waits until there is room.

Your caseload: each child's last message, urgent messages this week, targets on track and the next appointment

3. Your caseload

The caseload page shows every child shared with you: their school, the last message, urgent messages this week, how many targets are on track, and your next appointment. **Appointment summaries** lists the children in order of their next appointment, so you can prepare the week in one place.

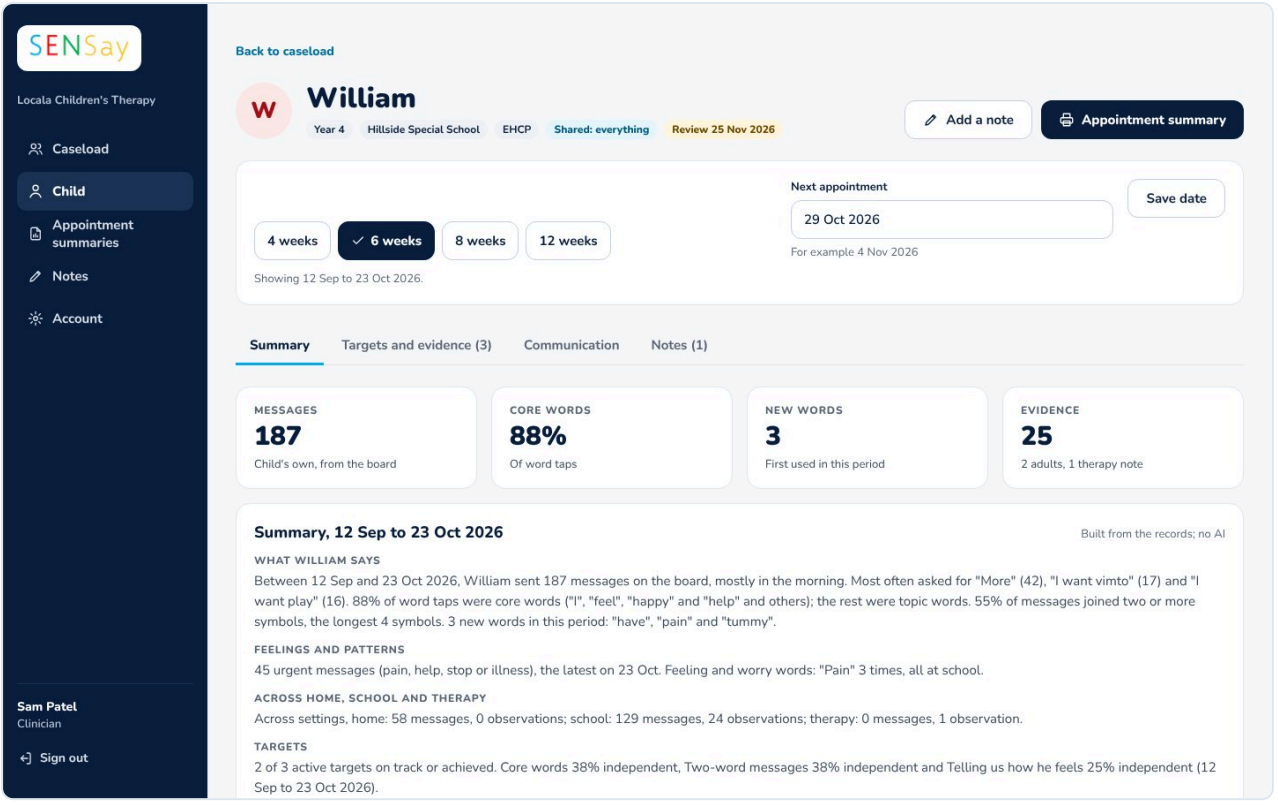

4. The child's page

Each child's page has four tabs, and a choice of the last 4, 6, 8 or 12 weeks.

Tab	What it shows
Summary	Messages, core word share, new words and evidence for the period, with a written summary built from counts in the record
Targets and evidence	School and therapy targets, with every observation and the level of support
Communication	What the child said: words, feelings, core and topic words, new words, and anything worth a look such as pain or distress
Notes	Your notes and the school's, newest first

The **appointment summary** is a printable page for the session or the file. It uses no AI: every number comes straight from the record, repeats within five minutes are counted once, and adult modelling is excluded. You can add a short drafted paragraph if you want one; it is marked as a draft for you to check.

If the family has chosen Plans and progress only, the page says that board messages are not shared.

The child's page: summary of the period, built from counts in the record

5. Notes and advice

After a session, add a note: the kind of session, where it took place, the support the child needed, the words they used, and an optional school target it relates to. The **Advice for home and school** field is the most useful part: the family sees it under From school, and the school sees it in the child's evidence. One piece of advice reaches every adult around the child.

6. What the data can and cannot tell you

SENSay records what the child selected on their SENSay board, when, where (home, school or therapy, as set on the board), and the sentence the board spoke. It also holds the school's observations and your notes.

- **Modelling is separated.** Messages sent while an adult is modelling are marked and left out of the child's counts.
- **Play is folded.** A burst of the same message within a few minutes counts once, and families can mark a message as play, so the patterns are not inflated.
- **Context matters.** Each message keeps the messages before it, which often explain it ("I feel tired" eighteen minutes before "I want Vimto").
- **The record is only as complete as its use.** A quiet week may mean the board was not to hand. The summary shows the dates the data covers.
- **AI readings are suggestions.** Where a family uses AI insights, any interpretation is labelled as a suggestion, never as the child's words, and never shown to the child.

7. Children on other devices

Many children on your caseload use TD Snap, Grid 3, a PRC-Saltillo device or another system. **SENSay Connect** reads the usage those devices already record, and shows each child's use, vocabulary growth and target words over months, across a whole caseload, with a weekly list of children whose device has gone quiet.

System	What Connect reads	Modelling separated?
TD Snap	Usage reports from myTobiiDynavox (.xlsx)	Yes
Grid 3	The user's spoken history (history.sqlite)	No
TouchChat, LAMP Words for Life, Accent	Data logging file (logFile.txt)	No
CoughDrop	Open Board Logs (.obl)	Where recorded
Speak for Yourself	History export (.csv)	No
Any other system	A spreadsheet of words or buttons used	If it has a column for it

Proloquo2Go and Proloquo do not offer a usage export yet, so Connect cannot read it. The separate Connect guide covers it in full.

8. Clinical safety and data protection

- **Consent:** the family shares each child with you and can stop at any time.
- **Data:** held in the EU (Ireland), encrypted in transit and at rest, never sold, and never used to train AI.
- **Not a medical device:** we do not consider SENSay a medical device. It makes no diagnosis or clinical decision. Status flags and summaries are prompts for your judgement.
- **NHS assurance:** we are working through the Data Security and Protection Toolkit, the Digital Technology Assessment Criteria and a DCB0129 clinical safety case, and will share progress with your information governance team.

9. Prices

- **Clinician:** £249 a year plus VAT, for a caseload of up to 40 linked children.
- **Larger caseloads:** ask us. The caseload page shows when you are near the limit.
- **Services and trusts:** SENSay Connect is priced for teams. Services can start with a free 90-day trial for up to 40 children; see the Connect guide.

10. Getting started

- [ ] A family shares their child with your email
- [ ] Sign up and choose "I am a therapist or clinician"
- [ ] Set the next appointment on the child's page
- [ ] Print the appointment summary before the session
- [ ] After the session, add a note with advice for home and school
